

# **Biomoby Vancouver Meeting report**

## **Overview**

For about 3 hours on Wednesday afternoon, August 17th, Mark Wilkinson and Benjamin Good of the MOBY project working at the University of British Columbia, met with the GCP workshop team and discussed MOBY application to the GCP platform.

One key observation was that the core metadata models of the GCP domain model (i.e. Entity, Identifier, Feature, etc.) was possibly easily translateable into semantic web formalisms like RDF/OWL. A core set of MOBY datatypes and services to query the GCP domain model should be feasible with a modest bit of effort.
